Rarebookclub.com, United States, 2013. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1920 edition. Excerpt: .a pumping station imposes on a power house is of interest. It costs much less per kilowatt-hour to furnish energy to a motor that runs steadily with a uniform load 24 hours per day than where it runs only a few hours per day. Also, energy used during periods when the power plant is not carrying its heaviest load--off-peak energy as it is usually called--can be purchased cheaper than used during the peak-load period of the day. The power demand of a water plant with a given pumpage will depend upon the kind of water system and the type of pumps used. Where the pressure of the mains is maintained directly by the pumps, the power input will be almost constant, while in those plants where the pumps operate only a few hours per day while filling a storage tank, the power demand will be intermittent in character and in general will be larger than with the other system. The coal consumed in pumping water in small plants with steam pumps is about five times that necessary to generate the electrical energy required to pump the same amount of water with motor-driven pumps. The energy consumption in properly designed plants for conditions obtaining in the State of Indiana may be expected to vary from 0.5 to 3.0 kw.-hr. per 1,000 gal., 1.25 kw.-hr. per 1,000 gal. being a fair average. The corresponding energy consumption per 1,000 gal. per 100 ft. of head varies from...
